What is Levetiracetam?

Levetiracetam, also known under the brand names, Keppra and Keppra XR, has been approved by the Food and Drug Administration to treat partial onset seizures, or seizures that begin in a limited area of the brain. Keppra can be used along with other seizure medicines in people 4 years of age or older. Keppra has also been approved for the treatment of myoclonic seizures in adults and for juvenile myoclonic epilepsy in people 12 years or older.

- This medicine is excreted by the kidneys and the dose or way it is taken may be different in people with kidney problems.
- Follow the exact directions given to you by your doctor.
- Always check the appearance of the tablets with the pharmacist when the prescription is filled to be certain you are given the right medication.

Important questions to ask your doctor:

- Why am I being given this medicine? ________________________________
- What amount should I be taking? ________________________________

What does the drug look like and how should I take it?

Keppra Tablets ®
Available in four strengths:

- 250 mg (light blue) Marked with ucb 250
  ![Image of 250mg tablet]
- 500 mg (bright yellow) Marked with ucb 500
  ![Image of 500mg tablet]
- 750 mg (light peach) Marked with ucb 750
  ![Image of 750mg tablet]
- 1000 mg (white) Marked with ucb 1000
  ![Image of 1000mg tablet]

To take tablets:
- Swallow the tablets whole with a glass of water.
- Take with food to lessen stomach upset.
- To mix with food:
  - Crush tablet and mix with small amount of soft food.
  - Make sure to take all of the crushed medicine.
- Usually taken twice a day.

Film-coated tablet, imprinted with “UCB 500XR in red on one side

750 mg (white)
Film-coated tablet, imprinted with “UCB 750XR in red on one side

Frequently Asked Questions:

Is it best to take this medicine with food? This medicine can be taken with or without food. Taking it with food may prevent stomach upset. Try to take it the same way each day, since taking this with food may change the time it takes to be absorbed.

What should I do if I miss a dose? If you miss or forget a dose take it as soon as possible. However, if you have missed a dose and it is within a few hours before your next dose, take only the next scheduled dose. Do not double up or take extra medicine, unless instructed to do so by your doctor.

How can I remember to take my medicine?
• Take medicine at the same time each day.
• Take medicine at the same times as some other routine, such as brushing teeth, after meals, or bedtime.
• Use a pillbox so you can check if you have taken a dose.
• Use an alarm to remind yourself of times to take a dose.
• Keep a written schedule or chart of when to take the medicine.
• Talk to your doctor or health care provider about problems remembering to take the medicine.

How long will it take for the medicine to work? It may take a number of weeks to find the right dose, and then more time may be needed to know how well the medicine works to control your seizures. How long this takes will be different for each person. It may depend on how often you have seizures, what other medicine you may be taking, and how your body responds to the drug.

Should I write down how the medicine is affecting me? It is important to write down how you feel while you are on the medicine. Also keep track of changes in how much medicine is prescribed, side effects, and changes in seizures. Take the information to all follow-up visits with your health care providers.

How should I store my medicine? Store the medicine at room temperature (25˚ C or 77˚ F), away from heat, moisture and direct light. Do not freeze the syrup. Keep it out of the reach of children. Don’t keep in the bathroom, glove box of a car, or where children can easily find them, such as in purses or low cabinets or counter tops for example.

Will this medicine affect other medicines that I am taking? Levetiracetam is not known to interact or affect other medicines. Make sure to tell all your health care providers the names of all medicines, herbal or dietary supplements, vitamins and over-the-counter medicines. Please see the AED Interaction Sheets for more information about drug interactions. (http://professionals.epilepsy.com/pdfs/epilepsy-levetiracetam-912.pdf)

What side effects may occur? Side effects may occur with any medicine. Some side effects will go away on their own or when the dose of medicine is changed. Others may be more serious indicating that your body is not tolerating the drug. Tell your doctor about all side effects that occur, but do not stop taking the medicine without advice from your doctor. Some side

Effects include the following:

**Common:** Tired, sleepy, general weakness or lack of energy, nervous, dizziness, irritable, agitated.

**Potentially serious:**

- **Rash:** Not all rashes are caused by the medicine, but all rashes should be reported to your doctor and checked out. Rashes that may be more serious usually begin in the first few weeks, but can happen at any time while you are on the drug. Serious rashes may have the following symptoms and require immediate evaluation:
  - Blisters or sores in mouth, eyes, ears, nose, and genital area.
  - Swelling of eyelids or red eyes.
  - Red spots or patches on skin.
  - Fever or flu-like symptoms that don’t go away.

- **Other serious but rare side effects:** Depression, severe anxiety, or agitation.

- **Allergic reaction:** May be seen with symptoms such as hives or large red spots on the body, itching, difficulty breathing or closing of the throat.

On July 10, 2008, an advisory panel was convened by the Food and Drug Administration (FDA) to review data that the FDA had previously collected from drug studies showing an association between many of the antiepileptic drugs (AEDs) and suicidal ideation and behavior, which together are called suicidality. According to the FDA’s Alert, among the patients with epilepsy in these drug studies, 1 out of 1000 people taking the placebo (inactive substance) showed suicidality compared to approximately 3.5 out of 1000 people who took an AED. The FDA advisory panel voted to accept the FDA’s data at its meeting on July 10.

The FDA has provided the following information for patients, family members, and caregivers at www.fda.gov/cder/drug/InfoSheets/HCP/antiepilepticsHCP.htm):

- Taking antiepileptic medicines may increase the risk of having suicidal thoughts or actions;
- Do not make any changes to the medication regimen without first talking with the responsible healthcare professional;
- Pay close attention to any day-to-day changes in mood, behavior and actions. These changes can happen very quickly so it is important to be mindful of any sudden differences.
- Be aware of common warning signs that might be a signal for risk of suicide. Some of these are:
  - Talking or thinking about wanting to hurt yourself or end your life
  - Withdrawing from friends and family
  - Becoming depressed or having your depression get worse
  - Becoming preoccupied with death and dying
  - Giving away prized possessions

We again urge patients and families to contact their doctor before stopping an epilepsy medication because this may possibly lead to seizures and worsening of mood.

**When should I call my doctor?**

- Call a doctor right away if side effects become severe or cause problems in your ability to function, or if you have any of the following problems: difficulty walking, confusion, rash, or allergic reaction.
- Do not stop the medicine without talking to your doctor first.

**Can this seizure medicine affect bone health?** Some seizure medicines can cause thinning of the bones. While levetiracetam is not known to cause bone problems, all people taking seizure medicine should take calcium and vitamin D supplements each day. Regular exercise and diet are also very important. People who have thinning of the bones may also need to take prescription medicines to treat this. Talk to your doctor about how to check the health of your bones and what to do next.

**Can I drink alcohol while on this medicine?** People taking this medicine should not drink alcohol, because levetiracetam can increase the effects of alcohol.
May I drive while taking levetiracetam? Use caution when driving, operating machinery, or performing other hazardous activities. Levetiracetam may cause dizziness and drowsiness. If you have these problems or are having seizures, avoid these activities and talk to your doctor.

Just for Women:

Is this medicine safe to take during pregnancy? Levetiracetam has an FDA pregnancy category of “C” meaning that the benefits of the medicine may outweigh the risks of harming the fetus. If you find or suspect you are pregnant, continue taking the medicine and contact your doctor right away. Talk to your doctor about the potential benefits and risks before making any decisions about use of this medicine. Seizures can be harmful to the mother and the developing baby, but these risks can be managed with proper care.

Does this medicine affect birth control pills? Levetiracetam has not been reported to cause problems with hormonal contraceptives or birth control. Talk to your doctor if you start or stop hormonal birth control while taking this medicine. Call your doctor if you have any signs of breakthrough bleeding or symptoms of pregnancy.

Will the medicine affect my menstrual cycle? This medicine should not affect the menstrual cycle. If your cycle becomes irregular, call your doctor.

Can I breast feed while taking this medicine? In general, women taking levetiracetam can breastfeed while using this medicine. It is not known if this drug passes into the breast milk. According to the American Academy of Neurology, the benefits for the infant and mother are believed to outweigh the risk for adverse effects. Talk to your doctor regarding this option.

Are there any specific vitamins I should be taking? Women who could possibly get pregnant should be taking at least 0.4 milligrams (mg) of folic acid or folate each day. Doctors may recommend that women with epilepsy taking seizure medicine take a higher dose of folic acid, up to 4 mg each day. Talk to your health care provider for specific instructions. Folic acid is also found in leafy dark green vegetables, fruits and juices, and lentils.
